

## **Revolution in electric vehicles - electricity for 500 km in 3 minutes**

An ABC electric vehicle is a new, patent-pending invention. When "refueling" at an ABC filling station, the ABC electric vehicle has electricity for approx. 500 km **within 3 minutes (!!!)** and can continue the journey.

“Refueling” with electricity with the system according to the invention does not take longer than refueling gasoline or diesel vehicles. All of this is achieved through the ABC (**A**utomatic **B**attery **C**hanging) system.

The used batteries of an ABC electric vehicle are **automatically** replaced by unused, fully charged batteries at an ABC filling station, that's it. The replacement of used, empty batteries with fully charged batteries is usually done via the vehicle floor and the petrol station floor, which both open and close automatically to change the batteries.

The patent holder offers car manufacturers and petrol station providers super-cheap license fees. It is also possible to purchase a patent.

Patent holder of patent CH-070342/2021, (filing date October 2, 2021):
